QUANTITATIVE BACKTEST COMPREHENSIVE REPORT

Full-History Strategy Retraining & Cumulative Accumulated PnL Analysis (2019 - 2026)

Executive Performance & Risk-Return Dashboard

This dashboard presents a comparative risk-adjusted analysis of our trading systems: Static Baseline (SB), Dynamic Threshold (DT), and Ticker Suspension (TS). Standard mathematical ratios like Sharpe, Sortino, and Calmar are evaluated using a standard starting capital of Rs 600,000 (6 Lakhs Rs) over the entire backtest history. Subsequent pages provide yearly strategy tables and dedicated monthly accumulated equity curves.

Visual Yearly Performance Comparison (2019 - 2026)

This section visualizes the key performance statistics across all three basic strategies: Static Baseline (SB), Dynamic Threshold (DT), and Ticker Suspension (TS). The bar charts compare Yearly Net Cumulative PnL, Trade Win Rates, and overall Trade Counts side-by-side. These charts clearly demonstrate the trade-offs of each system under yearly walk-forward retraining.

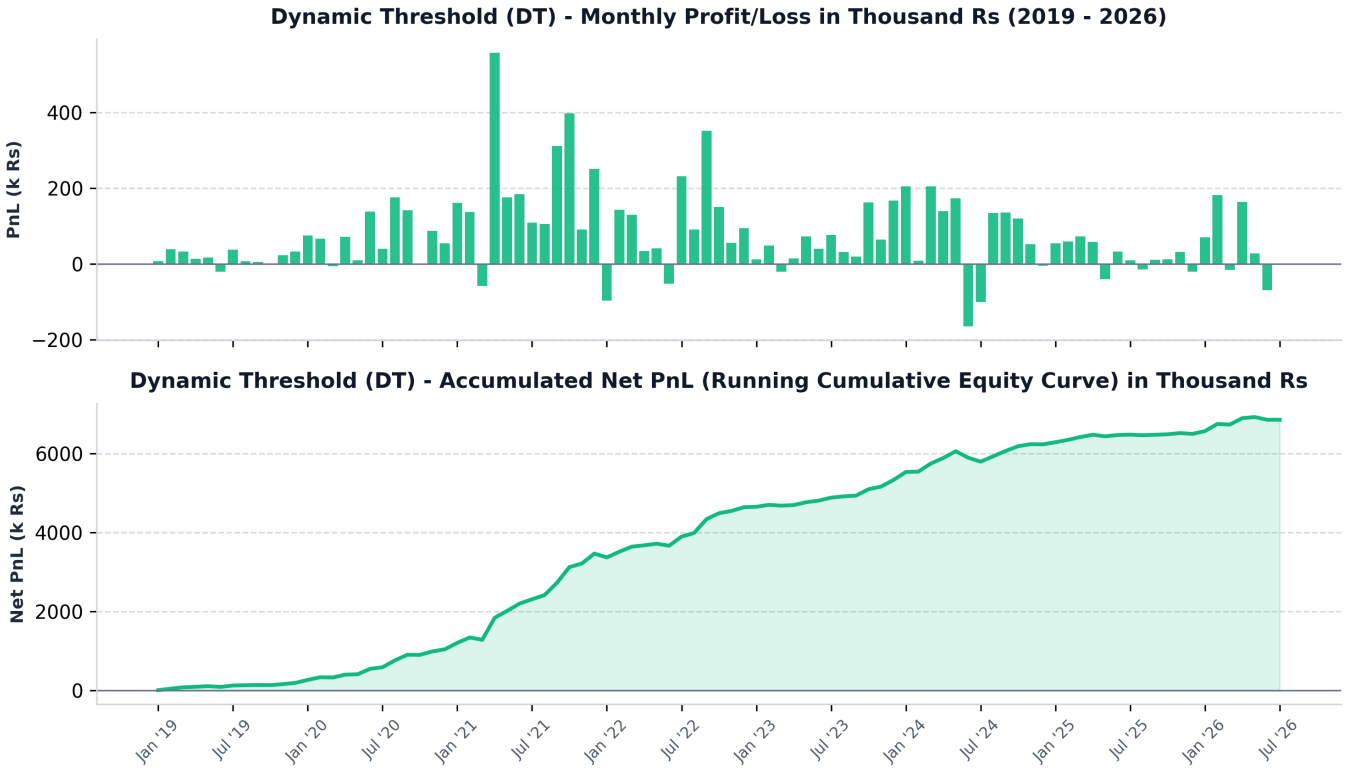

Static Baseline (SB) Detailed Monthly & Equity Curve History (2019 - 2026)

The Static Baseline (SB) strategy maintains a robust profit accumulation path over the 8-year testing period. Its equity curve (running cumulative PnL) shows stable upward trajectory, driven heavily by exceptionally strong performances in the 2020-2021 market cycles, where monthly trade counts peaked. The strategy encountered a soft drawdown during 2025 where multiple individual months yielded net negative returns due to compressed win rates, but rebounded strongly in early 2026 to push the accumulated PnL to its near-peak level.

Dynamic Threshold (DT) Detailed Monthly & Equity Curve History (2019 - 2026)

The Dynamic Threshold (DT) strategy is the overall performance leader, reaching a net cumulative PnL of over Rs 5.2 Million (the highest among all strategies). Its equity curve represents superior capital preservation, specifically during high-volatility environments like 2022 and late 2025. By dynamically adapting its prediction thresholds, DT effectively filters low-probability entries during flat or choppy market periods. This adaptation minimized losses in the late 2025 drawdown and supercharged the 2026 recovery phase.

Ticker Suspension (TS) Detailed Monthly & Equity Curve History (2019 - 2026)

The Ticker Suspension (TS) strategy incorporates a safety fallback mechanism to protect capital by suspending highly speculative assets during system spikes. While this protective measure ensures capital safety during extremely critical years (evidenced by the highest minimum yearly return in 2025 with Rs 775 average trade PnL), it also filters out multiple high-yield entries. Consequently, its overall running equity curve rises at a shallower angle, resulting in a slightly lower overall net cumulative accumulated PnL of Rs 4.98 Million.
